

DataHive's Colocation Service provides our clients with an uncompromised level of security and availability of their data and still have the freedom to focus on their wide variety of core initiatives and responsibilities. DataHive endeavors to have a working relationship with clients and to this end offers our assurance of the best possible personalized service to ensure your requirements are met and supported.

Uptime is the number one requirement of all businesses and to facilitate a 100% uptime goal DataHive provides all clients with three BGP failover providers: Shaw, Allstream and Hurricane Electric.

In addition DataHive is carrier neutral, hosting Telus, Allstream, Bell, City Fibre, TeraGo, Shaw, Hurricane Electric, Wi-Band, Supernet and others. Diverse fibre entrance paths into the building are offered. Additionally, our clients have the advantage of contracting directly with Hurricane Electric (HE) for worldwide transit at a fraction of current costs with other providers. Their website is here: <http://www.he.net/>

In 2013, Calgary business community faced a phenomenal flood that affected almost every business in the city. To our knowledge DataHive was the only data centre that was able to deliver its well-known, prompt and individual customer service 100% of the time.

This excellent service was demonstrated again when the Enmax manhole explosion devastated business operations to the point that downtown Calgary was blacked out for five days. During that time, DataHive again was fully operational with all clients up and running without one moment of downtime.

How was DataHive able to do this when others were not? We attribute this success to four key elements: a powerful UPS; a 72-hour generator; a backup generator; and state-of-the-art redundant air conditioning.

While it is not possible to control all environmental and unpredictable occurrences, DataHive's maintenance standards and monitoring schedules represents a source of reliability in giving our client's performance to their clients. DataHive maximizes its overall effectiveness by involving the full staff team at all levels and functions to focus on insuring efficient, preventative maintenance, all contributing to ongoing reliability.
